Rainfall vs Production by Year Group

Key Insights & Recommendations

Key Insights

- Rainfall varies significantly across years and regions
- Moderate positive correlation exists between rainfall and production
- Bihar and Orissa show higher production levels
- Rainfall peaks during monsoon months
- Some states achieve higher efficiency with moderate rainfall

Recommendations

- . Improve irrigation systems in low rainfall regions
- . Adopt modern farming techniques
- . Use rainfall forecasting for better planning
- . Focus on region-specific agricultural strategies

Executive Summary:

This dashboard analyzes the relationship between rainfall patterns and agricultural productivity across Indian states from 1966 to 2017. The objective is to identify rainfall trends, evaluate their impact on crop production, and provide actionable recommendations for improving agricultural performance.

Key Insights:

- Total agricultural production reached 243.35K across all states.
- Total recorded rainfall was 877.68K mm during the analysis period.
- West Bengal emerged as the highest-producing state.
- Rainfall and agricultural production show a positive relationship.
- Several states achieved strong production despite moderate rainfall levels, indicating efficient farming practices.
- Production levels vary significantly across regions due to rainfall distribution and cultivation patterns.
